For my project, I wanted to do something that I am familiar with. I have an interest in the NBA and players have stats that can be put into data. I wanted to choose an easy stat that would be easy to access, so I chose players' points per season. Now I had to choose the team that I wanted to go with and went with the Warriors. I took the five starting players' points and put them in the dictionary and was able to find the average throughout their careers.

The hardest part of my project was trying to get .csv to work. Mirco excel software does not have a direct way to create a CSV file. I was able to find out a way how to do it but by that time I just made a dictionary instead with the players' stats instead. If I had more time to work on this project, I would have added other stats like rebounds and steals into the mix and maybe some pictures in there. I love experiences like this because I get to combine interactions with things I like, like basketball and put them into my code. This lets me be more invested in what I am doing.
